

WIR VERSTEHEN DIE ZEICHEN DER ZEIT
KEEPING PACE WITH THE SIGNAL OF TIME

Compliance Statement

With excessive sensibility and compliance with German and international export regulations we act on a worldwide basis.

MEDAV Mission and Compliance

Company Profile MEDAV is a leading global high-tech company operating in the government as well in the test and measurement market. Covering the whole chain of products from the sensor to a well analysed result is the most important element of MEDAV company policy today. Innovation and networking with partners within research are the basis for the development activities. The products are of interest for a broad field of applications and customers

Products Vibro-acoustic measurement and classification products support development and quality control processes in different industries. Speech classification and recognition products are close to the measurement products from a technological point of view. Radio measurement and monitoring products process signals up to some Giga Hertz frequency range and some Mega Hertz of bandwidth; the spectrum of products includes antennas, receivers, direction finding and localization solutions. Channel sounders are highly specialized measurement solutions for the detailed analysis of all characteristics of the radio channel and all static and dynamic effects of the propagation of electromagnetic waves.

Signal acquisition and the collection of raw information would be useless if no processing and analysis would follow. The support of these processes by means of computer aided work flow and data handling systems define another vital complementary field of products, solutions and engineering which is offered by MEDAV. The main principles are based on the so called intelligence-cycle. The traditional intelligence-cycle is a concept dedicated for the transformation of raw information into finished intelligence for policymakers and military leaders. MEDAV understands the intelligence-cycle processes to be useful in much larger scope of applications handling data and information in non-governmental organizations and applications

Compliance Automotive and other industries are customers for MEDAV test and measurement products. Governmental customers are interested in the radio measurement and monitoring products. Due to the fact that technology, customers and applications may concern public security interests, a consequent analysis of business cases is necessary to avoid undesirable transfers of goods or services.

Nevertheless not every product, software solution or technical concept which can be used in security related applications is sensitive for the purpose of compliance rules. Technical parameters, performance and the global availability of technology and solutions and – of course- official regulations have to be taken into regard.

Reasonable sense of responsibility is practiced and drives company internal evaluation and decision processes. MEDAV is following consequently a policy of strict compliance with rules based on German, European law, international agreements and a high ethical standard.
